

# Python for Data Science & Clean Coding

## Week 02 Internship Reflection:

During this week of internship I revised the fundamentals concepts of programming. I reviewed key topics including List , Tuples , Dictionaries , File handling ,CSV handling , Loops , Functions , Exception handling and Conditional statement .To strengthen my understanding, I applied these concepts through practical coding exercises and practice questions. I explore various learning resources such as GeeksforGeek , W3School and YouTube tutorials to gain deeper understanding of each topic . Additionally I used platforms like LEETCODE and HackerRank to explore the types of programming problems commonly asked and to improve my problem solving skills by attempting to solve them . Some of the practice problems I tried to worked on included: Maximum Product Difference Between Two Pairs (Find two pairs of numbers in a list such that the difference between their products is maximum) , Lists (Performing various operations on a list such as inserting, appending, removing, sorting, reversing, and displaying elements according to user commands).

As part of the weekly tasks , I worked on reading and analyzing data sets . I also developed a mini utility called Data Health Checker , which analyses data and give important information like missing values , data types , rows and columns and basic statistical summary. To complete this task I used Pandas library which helped me efficiently inspect and analyze CSV data.

Overall this week activities strengthened my understanding of core concepts , improved my Python programming and provided practical experience in data inspection and automation.
