

SCREENSHOTS-DASHBOARD

Public Data Insights Dashboard

Introduction

The dashboard analyzes a cleaned Netflix dataset containing **8,709 titles**, including both Movies and TV Shows released between **1925** and **2021**. The dataset covers content from **128 countries** and includes important attributes such as content type, release year, rating, genre, duration, country of origin, and the date each title was added to Netflix.

The primary goal of this dashboard is to transform the raw Netflix dataset into meaningful and interactive visualizations that help identify trends, content distribution, and viewing patterns. By exploring the dashboard, users can better understand Netflix's content strategy, discover key insights about its library, and identify potential opportunities for expanding content across different countries, genres, and audience categories. Users can also apply filters based on content type, release year, and country to perform more focused and interactive analysis.

Charts

1. Top 10 Countries by Number of Titles

What this shows: how many titles come from each of the top 10 producing countries.

Takeaway: Most of these titles come from just one place — United States, at about 40% of everything shown here. Everything else is split thinly across many smaller countries.

2. Titles Released Over Time

What this shows: the number of titles released each year, tracking growth or decline over time.

Takeaway: Netflix released way more titles in recent years than it used to — 2018 was the busiest year, with 1140 titles. Something clearly picked up speed after 2015.

4. Distribution of Release Years

What this shows: how many titles were released in each stretch of years, from the oldest to the newest.

Takeaway: Most titles here are pretty new — about 83% came out in 2015 or later. There isn't much older, classic content in the catalog.

5. Release Year vs. Duration (Movies)

What this shows: each dot is one movie, placed by the year it came out and how long it runs, so we can see if movies have gotten longer or shorter over time.

Takeaway: Movie length hasn't really changed much over the years. An older movie and a brand-new one are usually a similar length, around 97 minutes.

Dej

6. Duration Spread by Content Type

What this shows: the usual range of movie runtimes — the typical middle range, plus any unusually long or short titles.

Takeaway: Most movies run about an hour and a half to two hours. A few titles are much longer or shorter, but those are rare exceptions, not the norm.

7. Correlation Heatmap ↻

What this shows: whether release year, duration, and add-date tend to move together. A number close to 0 means "no real connection"; closer to 1 or -1 means they move together.

Takeaway: None of these numbers are strongly connected to each other. Knowing a title's release year doesn't really tell you much about how long it is or when it was added.

Depli

8. Top Genres (Category Comparison)

What this shows: the 10 most common genre labels in the catalog, side by side, so we can see which ones Netflix leans on most.

Takeaway: "International Movies" is the single most common genre. Along with Dramas and Comedies, just a few genres make up most of the catalog — everything else is a much smaller slice.

Key Insights

★ Movies make up about 70% of the whole catalog.

Why it matters: TV shows keep people coming back season after season. A catalog this movie-heavy gives viewers fewer reasons to stay subscribed month after month.

★ Most titles come from just one or two countries.

Why it matters: When most content comes from the same one or two places, it mostly reflects those cultures. Viewers in other regions may not see much of themselves in the catalog, which can hurt growth there.

★ The catalog is mostly recent content, with output rising sharply after 2015.

Why it matters: A young, fast-growing catalog is exciting, but it also means there isn't much older or 'classic' content — a gap for viewers who enjoy nostalgia or older favorites.

★ The catalog leans heavily toward mature and teen ratings.

Why it matters: Families with young kids may struggle to find enough suitable options, which could push them toward a competitor with a bigger kids' section.

★ Movie lengths are consistent and unremarkable (around 90-110 minutes).

Why it matters: This isn't a problem to fix — it's just confirmation that movie lengths already match what audiences expect.

Recommendations

HIGH PRIORITY

Add more TV Shows

Right now there are about 2.4 movies for every 1 TV show. Since people tend to stick around longer for shows than movies, growing this side of the catalog could help keep viewers subscribed.

HIGH PRIORITY

Add more content for kids and families

Only about 13.5% of titles are made for kids or the whole family. Most of what's there is meant for teens and adults, leaving a real gap for family viewing.

MEDIUM PRIORITY

Bring in content from more countries

About 47.3% of titles come from just two countries — the US and India. Adding more local shows from other regions could help attract new viewers there.

Conclusion

The analysis shows that Netflix's content library is primarily dominated by movies, with most titles originating from a limited number of countries, particularly the United States and India. It also contains a large proportion of content designed for mature audiences, while the platform has experienced significant growth in content additions since the mid-2010s.

From a business perspective, these findings highlight an opportunity for Netflix to broaden its content strategy. Expanding the variety of countries represented, offering a wider range of audience ratings, and increasing diversity across genres could help attract new viewers and better serve audience segments that are currently underrepresented. A more balanced and diverse content catalog would strengthen Netflix's ability to reach a broader global audience and support future growth.
