

Reflection Report

In this assignment, I not only learned about prompt engineering but I also applied it in practice. I wrote prompts for the eight given use cases and observed how different prompt designs affect the quality of AI-generated responses. I also learned about several techniques including Zero-shot prompting, Few-shot prompting, and Role-based prompting. Zero-shot prompts are the most basic prompts, in this prompt no example or details are given to the model, Few-shot prompts are the prompts in which few example or details are given to guide the model for desired output, Role-based prompt are the prompts in which model acts like an assistance, manager or analyst and generate response according to that role. For example, in Generating meeting minutes we have used this technique for writing a professional prompt, it acts like professional assistance. And give a response according to that. In addition to this, I learned the differences between basic, improved, and professional prompts and how LLM reacts to these prompts. For this assignment, I use Chatgpt 5.5 model to test my prompts and evaluate the quality of the generated outputs. Overall, this assignment helped me understand the importance of writing clear, structured, and well-defined prompts to obtain accurate and reliable AI responses.
