

PITB Generative AI Internship - Weekly Sync Notes

The Falcon Ridge Data Pipeline is an internal batch-processing system used by the Northbridge team to reconcile shipment records every night at 2:00 AM. It reads CSV exports from the warehouse system, validates each row against the master SKU list, and writes discrepancies to a flagged-items queue for morning review.

As of this quarter, the pipeline processes approximately 40,000 rows per run and has a target completion time of under 12 minutes.

The system owner is the Northbridge Logistics team, and any changes to the SKU validation rules must be approved by that team's lead.
